

Intel's Sustainability Impact

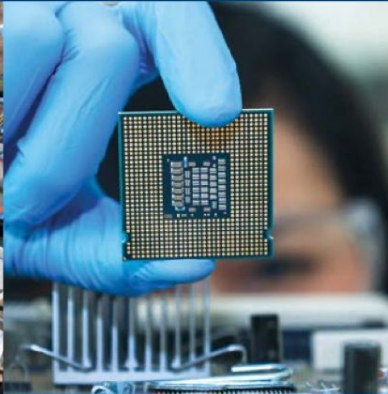

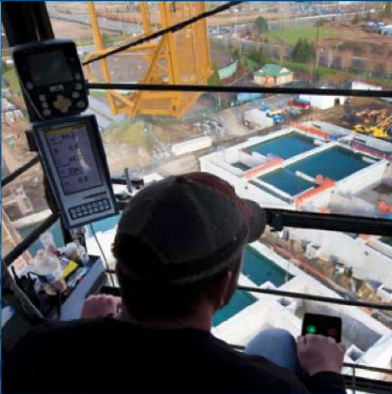

Intel is working to reduce its environmental impact through renewable electricity, lower greenhouse gas emissions, water conservation, circular manufacturing, and energy efficiency. These five insights highlight the scale of Intel's progress and the work still ahead.

Turning ambitious goals into measurable environmental progress

Amina Ali

August 3rd, 2026

99% OF INTEL'S GLOBAL OPERATIONS ARE POWERED BY RENEWABLE ELECTRICITY

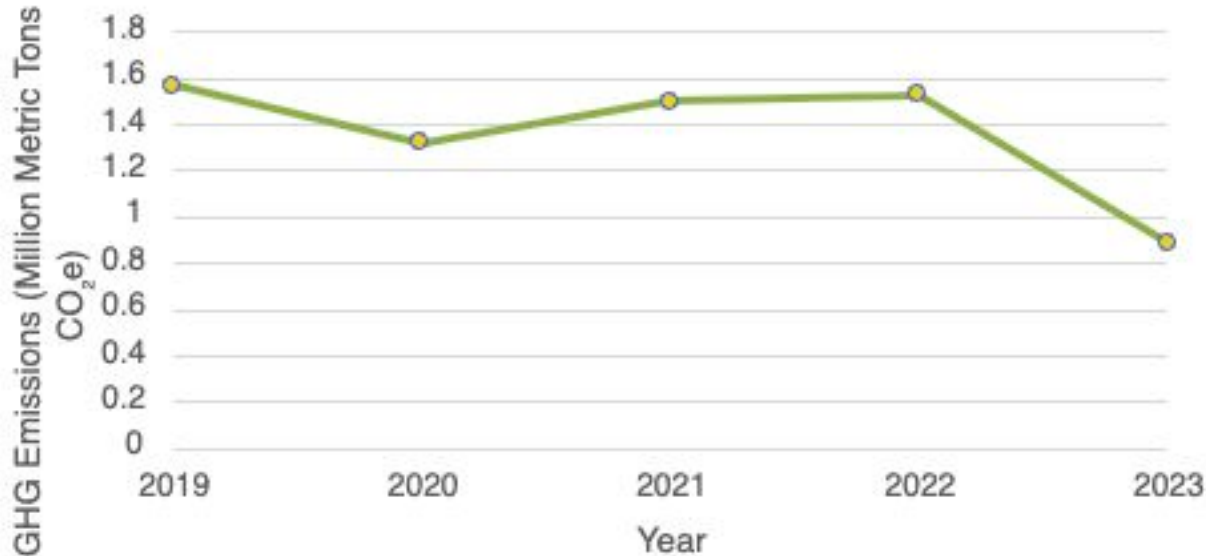

In just five years, Intel increased its renewable electricity use from 71% to 99% across its global operations. By relying on cleaner energy, Intel is reducing greenhouse gas emissions while moving closer to its long-term sustainability goals.

Nearly every facility is now powered by renewable electricity.

43% REDUCTION IN GREENHOUSE GAS EMISSIONS

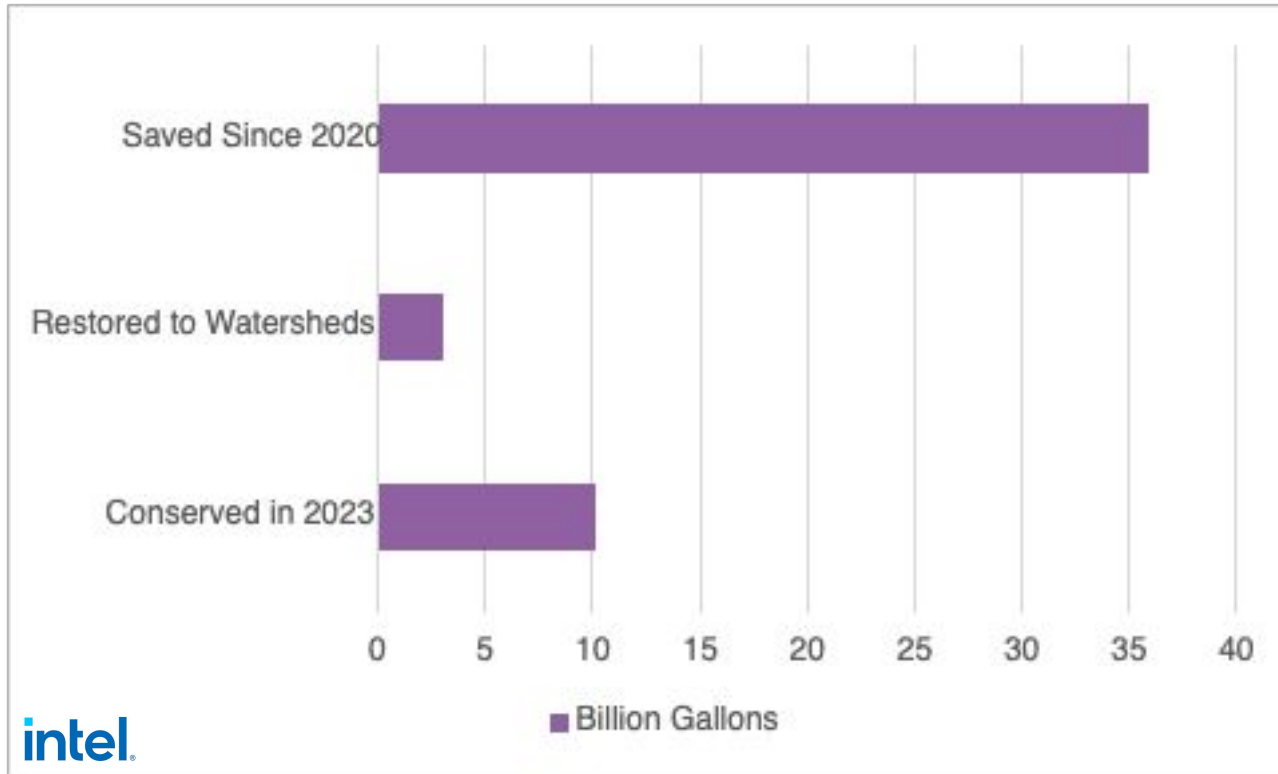

intel.

'GHG Emissions (Million Metric Tons CO₂e)' by 'Year'

Intel reduced its operational greenhouse gas emissions from 1.57 million metric tons in 2019 to 0.89 million in 2023. This 43% reduction shows meaningful progress toward a lower-carbon future through cleaner energy and more efficient operations.

36 BILLION GALLONS OF WATER SAVED SINCE 2020

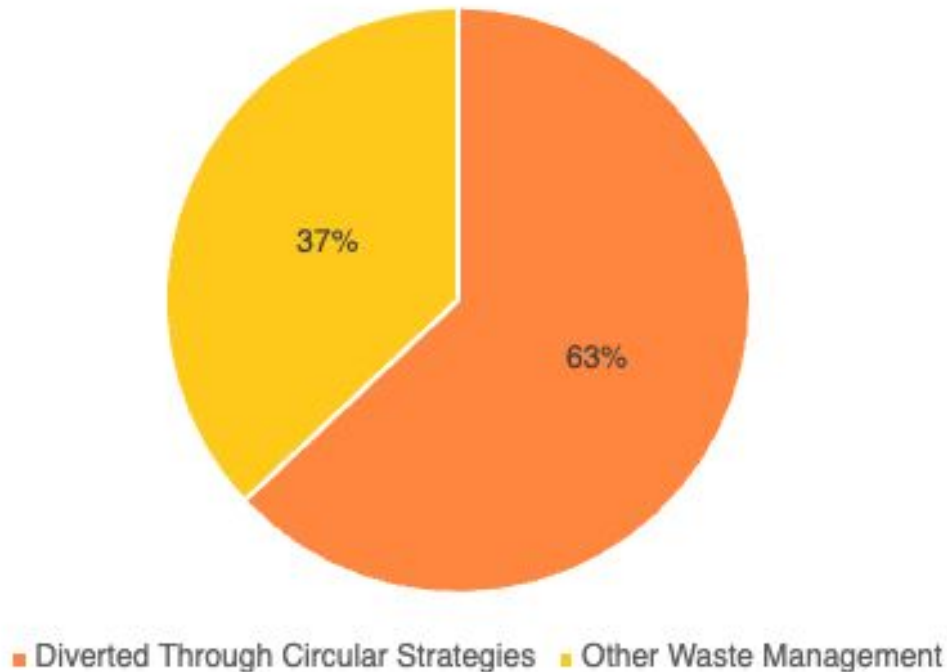

Since 2020, Intel has saved 36 billion gallons of water, helping reduce pressure on local water supplies and supporting communities where it operates. That's enough water to fill over 55,000 Olympic-sized swimming pools, making the impact easier to visualize.

Enough water to fill over 55,000 Olympic swimming pools.

63% OF MANUFACTURING WASTE WAS DIVERTED THROUGH CIRCULAR STRATEGIES

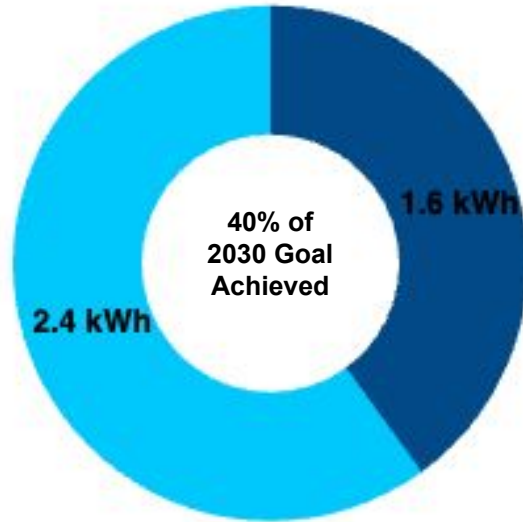

intel.

Intel diverted 63% of its manufacturing waste through recycling, reuse, and other circular strategies, while only 6% was sent to landfills. Keeping materials in use reduces waste and helps conserve valuable resources.

Only 6% of total waste was sent to landfills.

1.6 BILLION kWh OF ELECTRICITY SAVED SINCE 2020

intel.

■ Saved Since 2020 ■ Remaining to Reach Goal

Intel has already saved 1.6 billion kilowatt-hours of electricity since 2020, reaching 40% of its 2030 goal. Continued investments in energy efficiency will help reduce emissions while lowering energy use across global operations.

2030 Goal: 4 Billion kWh
